

No, the FCC should not mandate a copy protection mechanism in HDTV. I believe most people are going to be upset the first time they try and record something on HDTV and it has copy right protection on it and they can't record. This will make the public mad, and this more than content providers not wanting to put stuff on the air will be the adoption of the technology. If that is the case, it would be better for the industry to abandon the copy right technology, which they could not do if the FCC refused it. There is also the moral issue of requiring a device to prevent a person from recording something freely transmitted over the public airwaves. No, I do not think the FCC should mandate a copy protection mechanism in HDTV. No, the FCC should not mandate a copy protection mechanism in HDTV.
